

E-WIRE LIGHTS

E-wire lights is the brain child of Andy Horn, founder of Eco Design Architects & Consultants. These elegant features follow his ecologically-conscious architectural work. The light shades come in three different types, are made from recycled paper, and are adjustable, interchangeable and biodegradable. The shades are then attached to the timber base with recycled stainless steel wire. Horn uses alien wood harvested at a certain moon phase where the sap is low and there are no insects in the wood. Felling at this time also means that the wood doesn't crack and is of a high, durable quality. The wood is oiled and there is no need for chemical treatment. The base of the standing lamps and desk lamps are used metal car components such as brake discs and flywheels cleaned with a heated mix of linseed oil, beeswax and turpentine. The LED lights contain no mercury or poisonous gases.

The individual components ensure that each piece is unique. The range includes: a desk lamp (*umtata*), a standing floor lamp (*umkhulu*), a pendant light (*phezulu*) and a chandelier (*imbizo*). The fittings and custom designs are made to order.
